Final Exam

- Monday, December 8, 10:15 - 12:15
- In class
- Closed book
- Chapters 1-6, 11, 12
- Anything from readings and assignments

Final Exam Topics

- Emphasis on material since midterm
- Access control to class methods and data
  - Private data
  - Private helper methods
  - Public methods
  - Method signatures and overloading
- Nested and inner classes
  - Inner and outer class relationship
  - Scope of variables, methods
  - Access control of nested classes
Final Exam Topics

- **Static versus instance**
  - Static methods called without object
  - Instance methods require an object
  - Static data is per class, not per object
  - Instance data is for each object
  - `this` reference cannot be used in static method

- **Mutable and immutable objects**
  - Immutable objects cannot change after creation
  - `String`, `BigInteger` are immutable
  - Mutable objects have state which can change
  - `StringBuffer`, `StringTokenizer` are mutable

Final Exam Topics

- **Object references**
  - Difference between primitive variable and object
  - Object creation with `new`
  - What assignment means for objects
  - `what ==` means for objects
  - What it means for object variable to be null
  - Wrapper classes for primitive types
  - Garbage collection

- **Event – Listener model**
  - Relationship between objects
  - How one object knows about another
Final Exam Topics

- Arrays
  - Definition syntax
  - Initialization syntax
  - Element access syntax
  - Arrays are objects
  - Constant public `length` field of array
  - Valid index values for array access

- Multi-dimensional arrays

Final Exam Topics

- Abstract Data Types
  - Linked list
  - Stack
  - Queue
  - FIFO versus LIFO
  - Use of object references in links

- Java collection classes
  - Vector, LinkedList, ArrayList, Stack
Final Exam Topics

- May also cover topics of first half:
  - Java syntax
  - Java control flow, expression evaluation
  - Java data types and conversions
  - Interfaces
  - Recursion
  - Number base conversion

Studying for the Final Exam

- Review material covered in book
  - End of chapter summary
  - Self review questions
  - Program examples
- Review assignments
  - Understand “official” solution
  - Understand what is right and wrong with your solutions
- Review midterm
- Take sample final questions as serious test
Final Exam Question Format

- Multiple choice questions
- Programming questions
- Logic questions
- Design questions

Example Questions

Assume \( x \) and \( y \) are String variables with 
\( x = \text{"Hello"} \) and \( y = \text{null} \).
The result of \( x.length() + y.length() \) is

a) 0
b) 5
c) 6
d) 10
e) a thrown exception
If the statement `y=new String("Hello" );` is executed, then the value of `(x==y)` is

a) true

b) false

c) `x` and `y` becoming aliases

d) `x` being set to the value `null`

e) a run time error

Example Questions

If the statement `y="Hello";` is executed, then the value of `x.equals(y)` is

a) true

b) false

c) `-1`

d) `0`

e) a run time error
### Example Questions

If the statement

```java
x.replace('H', 'J').toLowerCase();
```

is executed, then the value of `x` is

- a) "Jello"
- b) "jello"
- c) "jELLO"
- d) "Hello"
- e) a run time error

### Example Questions

If the statements

```java
StringBuffer s = new StringBuffer(x);
s.replace(0, 1, "J");
```

are executed, then the value of `s` is

- a) "Jello"
- b) "Hello"
- c) "J"
- d) a run time error
Example Questions

In Java, arrays are

a) primitive data types
b) objects
c) interfaces
d) primitive data types if the type stored in the array is a primitive data type and objects if the type stored in the array is an object

Example Questions

What does this code do? (list is an array of int, temp is some int value, and c is an int initialized to 0)

\[\text{for}(j=0; j<\text{list}\cdot\text{length}; j++)\]
\[\text{if}(\text{list}[j] < \text{temp}) \text{ c++;}\]

a) finds smallest value and stores in temp
b) finds largest value and stores in temp
c) finds number of values equal to smallest in list
d) finds number of values in list less than temp
e) sorts values in list to be in ascending order
### Example Questions

Which of the following is true regarding outer and inner classes?

- a) no method of an inner class can be static
- b) no method of an outer class can be static
- **c) no data or method of an inner class can be static**
- d) no data or method of an outer class can be static

### Example Questions

The relationship between a class and an object is best described as

- a) classes are instances of objects
- **b) objects are instances of classes**
- c) objects and classes are the same thing
- d) classes are programs while objects are variables
Example Questions

If an int array is passed as a parameter to a method foo, which of the following would properly define the parameter list for the method signature?

a) foo(int [ ])
b) foo(a[ ])
\[c) foo(int[ ] a)\]
d) foo(int a)

Example Questions

Assume an int array, candy, stores the number of candy bars sold by a group of 12 children where candy[j] is the number of candy bars sold by child j. Which of the following could be used to compute the total number of bars sold by the children?

a) for(int j=1; j<12; j++) sum += candy[j];
b) for(int j=0; j<12; j++) sum = candy[j];
c) for(int j=0; j<12; j++) candy[j]++;
d) for(int j=0; j<12; j++) sum += j;
\[e) for(int j=0; j<12; j++) sum += candy[j];\]
Example Questions

What does the following code do?
```
int value1 = 0, value2 = 0;
for(int j=0; j<12; j++)
    if(candy[j] > value1) {
        value1 = candy[j]; value2 = j;
    }
return value2;
```

a) returns total number of candy bars sold
b) returns total number of children who sold > 0 candy bars
c) returns largest number of candy bars sold by any child
( )d) returns index of the child who sold the most candy bars

Example Questions

A linked list that stores int values would be comprised of a group of Nodes. We might define the Node by

a) class Node { Node next; }
b) class Node { int next; }
( )c) class Node { int data; Node next; }
d) class Node { int[] data; Node next; }
Example Questions

Given the linked list of Nodes with int values and head as the first node, implement the method add to add the Node to the end.

```java
void add(Node node) {
    if (head == null) head = node;
    else {
        Node temp = head;
        while (temp.next != null)
            temp = temp.next;
        temp.next = node;
    }
}
```

Example Questions

Code a recursive method `maxFrom` that takes a node and returns the maximum value of all nodes from that point on.

```java
public class IList {
    private class IntNode {
        int val; IntNode next;
        IntNode(int v) {val=v; next=null;}
    }
    private IntNode head = null;
    public int max() { return maxFrom(head); }
}
```
Example Questions

int maxFrom(IntNode node) {
    if (node == null) {
        return 0;
    }
    else {
        int tailmax = maxFrom(node.next);
        if (tailmax > node.value) return tailmax;
        else return node.value;
    }
}

Example Questions

Code a method named `twiceArray` that takes an array of ints and returns an array of ints where the values are all double the original values. The originals should not be changed.

```java
public int [] twiceArray(int [] orig) {
    int [] twice = new int [orig.length];
    for (int i = 0; i < orig.length; ++i)
        twice[i] = 2 * orig[i];
    return twice;
}
```

Twice.java
Example Questions

The following code implements a class named `Table` that stores integer values where the value is the sum of the row index and twice the column index. Find all the errors in the code and indicate if they are compile time or runtime errors and describe each error.

```java
public class Table {
    private int[][] data;
    public Table(int size) {
        for (int i = 0; i < size; ++i)
            for (int j = 0; j < size; ++j)
                data[i][j] = i + 2 * j;
    }
    public String toString() {
        String result;
        for (int i = 0; i <= data.length; ++i) {
            for (int j = 0; j <= data[i].length; ++j)
                result += i + "+2*" + j + "=" + data[j][i] + " ";
            result += "\n";
        }
        return result;
    }
}
```

- Need initialization (runtime): `data=new int[size][size];`
- Return value should be String (compile)
- `j` not declared (compile)
- Out of range, use `<` (runtime)
- not a method (compile)
- Result not initialized (compile)
- Wrong order of indices (runtime)
Example Questions

Code a class named `StringList` that uses the `Java LinkedList` class to store a list of Strings. Your class must make this driver code work.

```java
public static void main(String args[]) {
    StringList wl = new StringList();
    for (int i = 0; i < args.length; ++i)
        wl.add(args[i]);
    System.out.println("count () is "+wl.count());
    System.out.println("words are "+wl.toString());
    wl.reverse();
    System.out.println("words reversed are"+wl.toString());
}
```

(see next page for expected output)

Example Questions

The output from testing `StringList` looks like:

C:> java StringList ab cd ef ab Ab 12 59
```
count() is 7
words are [ab, cd, ef, ab, Ab, 12, 59]
words reversed are [59, 12, Ab, ab, ef, cd, ab]
```
Example Questions

class StringList {
    private LinkedList slist;
    public StringList() { slist = new LinkedList(); }
    public void add(String word) { slist.add(word); }
    public int count() { return slist.size(); }
    public String toString() { return slist.toString(); }
    public void reverse() {
        LinkedList nlist = new LinkedList();
        for (int i = slist.size() - 1; i >= 0; --i)
            nlist.add(slist.get(i));
        slist = nlist;
    }
}

StringList.java

Exam Strategy

☐ Do the multiple choice first
  ☐ Over half of the points
  ☐ Probably easiest, but read carefully!
☐ Pace yourself
☐ Leave time to check your work
☐ Relax
