1. *(Horner’s Rule)* Exercise 2.3, p 39, part a only. [3 points]

2. Suppose that $A$ is an array of integers, indexed 1 to $n$. Our goal is to compute the *prefix sums* of $A$, storing the result in $B$. These are defined as

The following simple code will compute the prefix sums

```c
for i=1 to n
    for j = i to n
```

What is the running time of this algorithm? (Use big-Oh notation.) [3 points]

3. What is the running time for the following code, which multiplies two $n \times n$ matrices $A$ and $B$, storing the result in $C$? [4 points]

```c
for i=1 to n
    for j=1 to n {
        C[i,j] = 0
        for k=1 to n
            C[i,j] = C[i,j] + A[i,k]*B[k,j]
    }
```

4. Determine the run times of the following two pieces of code, which do pretty much nothing. [6 points]

```c
sum =0
for i = 1 to n
    for j=1 to i*i*i
        sum += i*j
```

and

```c
sum =0
for i = 1 to n*n*n
    for j=1 to i
        sum += i*j
```
5. Show that \( \sum_{i=1}^{n} \lceil \log i \rceil = \Theta(n \log n) \). Do this directly, without recourse to Stirling’s approximation [6 points]

6. Suppose that each row of an \( n \times n \) array \( A \) consists of 1’s and 0’s in such a way that, for any row, all the 1’s come before any 0. Assuming that \( A \) is already in memory, describe how to find which row of \( A \) which contains the most 1’s. Aim to do this in \( O(n) \) time, not \( O(n^2) \). [6 points]

7. Occasionally, multiplying the sizes of nested loops can give an over-estimate for the big-O running time. This happens when an innermost loop is infrequently executed. With this in mind, determine the running time of the following piece of code. [8 points]

```c
for( int i = 0; i < n; i++ )
    for( int j = 0; j < i * i; j++ )
        if( j % i == 0 )
            for( int k = 0; k < j; k++ )
                sum++;
```

8. (Recurrence Relations) Exercise 4.3-1, p 75. [6 points]

9. (Recurrence Relations) Exercise 4.3-2, p 75. [3 points]

10. Describe a non-recursive method for finding, by link hopping, the middle node of a singly-linked list. This method must use only link hopping; it cannot use a counter. What is the running time of your method? [4 points]

11. (Reverse a linked list in constant space) Exercise 10.2-7, p 209 [8 points]

12. Describe how to implement the stack ADT using two queues. What is the running time of the push() and pop() methods in this case? [6 points]

Total: 63 points
