Chapter 5: Threads

- Overview
- Multithreading Models
- Threading Issues
- Pthreads
- Solaris 2 Threads
- Windows 2000 Threads
- Linux Threads
- Java Threads

Single and Multithreaded Processes
Benefits

- Responsiveness
- Resource Sharing
- Economy
- Utilization of MP Architectures

User Threads

- Thread management done by user-level threads library
- Examples
  - POSIX Pthreads
  - Mach C-threads
  - Solaris threads
Kernel Threads

- Supported by the Kernel
- Examples
  - Windows 95/98/NT/2000
  - Solaris
  - Tru64 UNIX
  - BeOS
  - Linux

Multithreading Models

- Many-to-One
- One-to-One
- Many-to-Many
Many-to-One

- Many user-level threads mapped to single kernel thread.
- Used on systems that do not support kernel threads.

Many-to-One Model

![Diagram showing Many-to-One model with multiple user threads mapped to a single kernel thread.](image-url)
One-to-One

- Each user-level thread maps to kernel thread.

- Examples
  - Windows 95/98/NT/2000
  - OS/2

One-to-one Model

user thread

k

k

k

k

kernel thread
Many-to-Many Model

- Allows many user level threads to be mapped to many kernel threads.
- Allows the operating system to create a sufficient number of kernel threads.
- Solaris 2
- Windows NT/2000 with the ThreadFiber package
Threading Issues

- Semantics of fork() and exec() system calls.
- Thread cancellation.
- Signal handling
- Thread pools
- Thread specific data

Pthreads

- A POSIX standard (IEEE 1003.1c) API for thread creation and synchronization.
- API specifies behavior of the thread library, implementation is up to development of the library.
- Common in UNIX operating systems.
Solaris 2 Threads

Solaris Process

Solaris process

- process id
- memory map
- priority
- list of open files

LWP₁ - LWP₂ - LWP₃
Windows 2000 Threads

- Implements the one-to-one mapping.
- Each thread contains
  - a thread id
  - register set
  - separate user and kernel stacks
  - private data storage area

Linux Threads

- Linux refers to them as tasks rather than threads.
- Thread creation is done through clone() system call.
- Clone() allows a child task to share the address space of the parent task (process)
Java Threads

- Java threads may be created by:
  - Extending Thread class
  - Implementing the Runnable interface
- Java threads are managed by the JVM.

Java Thread States

- new
- runnable
- sleep()
- suspend()
- i/O
- blocked
- stop()
- resume()
- dead
