Notifications and the Keyboard

(NSNotificationCenter)

- Singleton pattern, single notification center for dispatching and registering for notifications
- Many system provided notifications
- Custom notifications for app specific logic

NSNotificationCenter
Keyboard Notifications

- UIApplication sends many notifications for various events, including Keyboard showing/hiding
- Adjust the user interface in response to keyboard, so the user can still access necessary views
- Typically handled by changing the content inset and scroller content inset of a scroll view

Documentation
