Deliverables Walkthrough

- Consider: What kinds of questions should your documents answer?
  - Assume a manager unfamiliar with the project is reviewing your status
  - Would your documents answer key questions about the project goals and progress against plan?
  - Fill out only the parts that are relevant and useful!
- Team page: Who is on the team and what skills does each team member have?
- Project plan
  - Who is responsible for which tasks?
  - What are the anticipated risks and what are you doing about them?
  - What is your development process and how does it help address the risks?
  - Detailed Schedule & Milestones
    - What is the project schedule of tasks and deliverables?
    - What is the current status relative to schedule?

Walkthrough (2)

- Software Requirements
  - 2. ConOps: What capabilities will the software provide the user or customer?
  - 3. Behavioral Requirements: What are the detailed technical requirements?
    - Specific inputs accepted & outputs generated
    - Detailed behavior of any computation (e.g., sort, error responses)
  - 4. Quality Requirements: objective requirements for software qualities (e.g., reliability, performance)
- Software Design
  - Architecture: How is the software organized into components? Important relationships between components?
  - Module Interfaces: What are the component interfaces?
Walkthrough (3)

- **Quality Assurance**: How will you check whether the software satisfies functional and quality requirements?
  - Reviews: Which artifacts/properties will be checked by review?
  - Test Plans: How will you test the software?
- **Software Documentation**: How will users understand how to install and use the application?
  - Code: What do I need to know to find parts of the code responsible for implementing any given requirement or part of the design?
    - How is the code organized in the repository?
    - What does this code component do?

Understanding Software Requirements

"Problem solving is an art form not fully appreciated by some"

10,000 ft. View

What should the development process accomplish?
What is a “software requirement?”

• **Definition**: A description of something the software must do or property it must have
• The set of system requirements denote the problem to be solved and any constraints on the solution
  – Ideally, requirements specify precisely what the software must do without describing how to do it
  – Any system that meets requirements should be an acceptable implementation

importance of getting requirements right

1. The majority of software errors are introduced early in software development
2. The later that software errors are detected, the more costly they are to correct
Requirements Phase Goals

• What does “getting the requirements right” mean in the systems development context?

• Only three goals
  1. Understand precisely what is required of the software
  2. Communicate that understanding to all of the parties involved in the development (stakeholders)
  3. Control production to ensure the final system satisfies the requirements

• Sounds easy but hard to do in practice
• Understanding what makes these goals difficult to accomplish helps us understand how to mitigate the risks

“The hardest single part of building a software system is deciding precisely what to build. No other part of the conceptual work is as difficult as establishing the detailed technical requirements...No other part of the work so cripples the resulting system if done wrong. No other part is as difficult to rectify later.”

What makes requirements difficult?

• Comprehension (understanding)
  – People don’t (really) know what they want (…until they see it)
  – Superficial grasp is insufficient to build correct software

• Communication
  – People work best with regular structures, conceptual coherence, and visualization
  – Software’s conceptual structures are complex, arbitrary, and difficult to visualize

• Control (predictability, manageability)
  – Difficult to predict which requirements will be hard to meet
  – Requirements change all the time
  – Together can make planning unreliable, cost and schedule unpredictable

• Inseparable Concerns
  – Many requirements issues cannot be cleanly separated (i.e., decisions about one necessarily impact another)
  – Difficult to apply “divide and conquer”
  – Must make tradeoffs where requirements conflict
Requirements Process

Understand, Communicate & Control

• Managing requirements difficulties requires having a good process
  1. Requirements Understanding (Understand)
     – Elicitation: How do we establish “what people want?”
     – Negotiation: How do we resolve stakeholder conflicts?
  2. Requirements Specification (Communicate)
     – Concept of Operations (ConOps): How do we communicate with non-programmer audiences?
     – Software Requirements Specification (SRS): How do we specify precisely what the software must do?
  3. Requirements V&V (Control)
     – Validation: How do we establish that we have the right requirements?
     – Verification: How do we establish that the implementation is consistent with the specification?

3. Validation and Verification

• Part of Quality Assurance – provides feedback in the feedback-control-loop
• Validation: activities to answer the question – “Are we building a system the customer wants?”
  – Familiar activity: customer review of prototype
• Verification: activities to answer the question – “Are we building the system consistent with all specifications?”
  – Most familiar verification activity is functional testing
Project V&V

- QA Goal: How can we establish whether the development is under control?
- Project sub-questions:
  - How will you establish that the system does what it should?
  - What is the role of testing?
  - What can testing establish about system quality (and what can’t it)?
  - How will you write test cases?
    - E.g., for the class project

Understand, Communicate & Control

Managing requirements difficulties requires having a good process
1. Requirements Understanding (Understand)
   1. Elicitation - How do we establish “what people want?”
   2. Negotiation - How do we resolve stakeholder conflicts?
2. Requirements Specification (Communicate)
   1. Concept of Operations (ConOps) - How do we communicate with non-programmer audiences?
   2. Software Requirements Specification (SRS) - How do we specify precisely what the software must do?
3. Requirements Validation and Verification (Control)
   - How do we establish that we have the right requirements?
   - How do we establish that the implementation meets the requirements?

Product Development Cycle

Business Goals
- Hardware
- Software

Concepts (MRD)
- Business Spec

Technical Spec

Code

Test & Validate
- Customer acceptance tests
- Reviews
- V&V

CIS 422/522 Fall 2012
1.1 Elicitation

- **Goal:** Understand precisely what is required of the software
  - Answer the question, “What do the stakeholders want?”
  - Stakeholder: define as anyone with a valid interest in the outcome of a software development
- **Inherently open-ended, ambiguous question**
- **Addressed by a number of elicitation methods**
  - Interview – traditional standard
  - Focus groups
  - Prototyping
  - Scenario analysis (next), etc.
- **All have differing costs, strengths, and weaknesses. None is a complete solution**
  - Use more than one approach
  - Check the results early and often

1.2 Requirements Negotiation

- or “Why the customer is not always right.”
- Stakeholders’ requirements often conflict
  - Needs of different customers/users may conflict
    - E.g., Salesmen want convenience and speed, management wants security and accountability
  - Developer’s needs may conflict with customer’s
    - E.g., development cost vs. customer desires
- **Choosing which requirements should be addressed and their relative importance requires negotiation and tradeoffs among stakeholders**

2. Requirements Specification

- **Goal:** Communicate requirements understanding to all system stakeholders
- **Q:** What kinds of information need to be communicated?
  - System context
    - System stakeholders
    - Business goals
    - System purpose
    - Interfacing systems (if any)
  - System requirements
    - Behavioral requirements
    - Quality requirements
Purposes and Stakeholders

- Many potential stakeholders using requirements for different purposes
  - Customers: document what should be delivered, may provide the contractual basis for the development
  - Managers: provides a basis for scheduling and a yardstick for measuring progress
  - Software Designers: provides the “design-to” specification
  - Coders: defines the range of acceptable implementations and is the final authority on the outputs that must be produced
  - Quality Assurance: basis for validation, test planning, and verification
  - Also: potentially Marketing, regulatory agencies, etc.

Needs of Different Audiences

- Customer/User
  - Focus on problem understanding
  - Use language of problem domain
  - Technical if problem space is technical

- Development organization
  - Focus on system/software solutions
  - Use language of solution space (software)
  - Precise and detailed enough to write code, test cases, etc.

Two Kinds of Requirements Documentation

- Communicate with stakeholders who understand the problem domain but not necessarily programming:
  - e.g. customers, users, marketing
  - Do not understand computer languages but may understand technical domain-specific languages
  - Must develop understanding in common languages
  - Role of ConOps (Concept of Operations)

- Communicate with developers: sufficiently precise and detailed to code-to, test-to, etc.
  - Stated in the developer’s terminology
  - Addresses properties like completeness, consistency, precision, lack of ambiguity
  - Role of SRS (Software Requirements Specification)

- For businesses, these may be two separate documents
Documentation Approaches

- Informal requirements to describe the system’s capabilities from the customer/user point of view
  - Purpose is to answer the questions, “What is the system for?” and “How will the user use it?”
  - Tells a story: “What does this system do for me?”
  - Focus on communication over rigor

- More formal, technical requirements for development team (architect, coders, testers, etc.)
  - Purpose is to answer specific technical questions about the requirements quickly and precisely
    - “What should the system output for this set of inputs?”
    - Reference, not a narrative, does not “tell a story”
    - Goal is to develop requirements that are precise, unambiguous, complete, and consistent
    - Focus on precision and rigor

Informal Specification Techniques

- Most requirements specification methods are informal
  - Natural language specification
  - Use cases
  - Mock-ups (pictures)
  - Story boards

- Benefits
  - Requires little technical expertise to read/write
  - Useful for communicating with a broad audience
  - Useful for capturing intent (e.g., how does the planned system address customer needs, business goals?)

- Drawbacks
  - Inherently ambiguous, imprecise
  - Cannot effectively establish completeness, consistency
  - However, can add rigor with standards, templates, etc.
Mock-up Example

Analysis and Informal Specification with Use Cases

Use Cases

- Use Case: a story describing how the system and a user interact to accomplish a user task
- A form of User Centered Analysis – capturing requirements from the user’s point of view
  - Goal of helping identify user needs
  - Solve the right problem
- Use cases specify a subset of functional requirements
  - System behavior observable to the user
  - Focus on capabilities (value) provided to users
- Use cases do not specify design or implementation
Scenario Analysis Process

Applying scenario analysis in the requirements process

- Requirements Elicitation
  - Identify stakeholders who interact with the system
  - Collect “user stories” - how people would interact with the system to perform specific tasks
- Requirements Communication (ConOps)
  - Record as use-cases with standard format
  - Use templates to standardize, drive elicitation
- Requirements verification and validation
  - Review use-cases for consistency, completeness, user acceptance
  - Apply to support prototyping
  - Verify against code (e.g., use-case based testing)

Identifying Actors

- Actors – identifies a role different users plays with respect to the system
  - Roles represent different classes of users (use the system with different goals)
  - Actors carry out use cases
- Primarily useful in identifying different kinds of use cases
  - “How would depositors use the system?”
  - “How would a library patron use the system?”
- Important to keep in mind that there may be several diverse classes of users with very different goals and interfaces
  - E.g., users vs. administrators vs. content providers, etc.

UML Graphic Example

http://www.math.ccs.gordon.edu/local/sousa/cs211/ATMExample/
Scenario Elicitation

- Each class of actor is interviewed and/or observed
  - How do you do task T?
  - How will the user interact with the system to do X?
- Collect in the form of "user stories"
  - Documented as scenarios (informal or standardized)
  - Identify relative priorities of tasks
  - Resolve conflicts, tradeoffs

Creating Use Cases

- Identify a key actor and purpose
  - The purpose informs the use case title and description
- Identify the main flow (ideal path) from the starting point to the result
  - Preconditions: anything that must be true to initiate the Use Case
  - Trigger: event, if any, initiating the Use Case
  - Basic Flow: sequence of interactions from the trigger event to the result
  - Alternative Flows: identify sequences branching off the Basic Flow

Guidelines for Good Use Cases

- Use Cases should express requirements, not design
  - Focus on important results that provide value to specific actors
    - i.e., if nobody really cares about the outcome, it is not a good use case
  - Focus on what the actor is doing, not the details of how
    - Not: "The user left-clicks on the radio button labeled ‘Balance’ and presses the Enter button"
    - "The user elects the option to view the balance."
- Looking for a small number of use cases that capture the most important interactions
Address Book Example

- Who are the actors?
- What are the major tasks?
- What are the outcomes?
- What would be an alternative flow?

Summary

- Requirements characterize "correct" system behavior
- Being in control of development requires:
  - Getting the right requirements
  - Communicating them to the stakeholders
  - Using them to guide development
- Requirements activities must be incorporated in the project plan
  - Requirements baseline
  - Requirements change management
