Notifications and the Keyboard

NSNotificationCenter

- Singleton pattern, single notification center for dispatching and registering for notifications
- Many system provided notifications
- Custom notifications for app specific logic
**Keyboard Notifications**

UIApplication sends many notifications for various events, including Keyboard showing/hiding.

Adjust the user interface in response to keyboard, so the user can still access necessary views.

Typically handled by changing the content inset and scroller content inset of a scroll view (or a scroll view subclass).
