Lecture 7: enum, structs, and unions
Announcements

• Anyone bringing their family for Spring Family Weekend (Apr 28)?
• 2B due date: delayed one day due to error by Hank
• Tuesday OH: we will see
Announcement: textbook

- Linux Programming Environment by Kernighan & Pike (with modifications by J. Sventek)
- Posted to Canvas
- IMPORTANT:
  - This book contains copyrighted material. You may use it for this class under the following constraints:
  - "Permission is granted for one time classroom use for registered learners only. The duration of use is only for the duration of the course. The material may not be published and distributed outside of the course."
  - Thus, you may make a copy for your use on your own machine. You may NOT share this book with anyone outside of the class, nor may you post it anywhere on the web. Failure to abide by these rules will lead to significant legal difficulties for the University, the Department, your instructor, and yourself.
Grading (1/2)

• code isn’t always portable
  – Scenario #1
    • your compiler is smart and glosses over a small problem
    • my compiler isn’t as smart, and gets stuck on the problem
    • (fix: gcc --pedantic)
  – Scenario #2
    • memory error doesn’t trip you up
    • memory error does trip me up
    • (fix: run valgrind before submitting)
Grading (2/2)

• Graders will run your code
  – If it works for them, then great
  – If not, they may ding you

• → how to resolve?
  – ix.cs.uoregon.edu is my reference machine
  – if it works there, you have a very strong case for getting credit back

Memory Errors

- Array bounds read
  ```java
  int main()
  {
    int var;
    int arr[3] = { 0, 1, 2 };
    var=arr[3];
  }
  ```

- Array bounds write
  ```java
  int main()
  {
    int var = 2;
    int arr[3];
    arr[3]=var;
  }
  ```
Great question from last class

• int *X = 0xDEADBEEF:
• int Y = *X;

• what error code fits?

• I missed two:
  – Invalid Pointer Read (IPR)
  – Invalid Pointer Writer (IPW)
File I/O: streams and file descriptors

• Two ways to access files:
  – File descriptors:
    • Lower level interface to files and devices
      – Provides controls to specific devices
    • Type: small integers (typically 20 total)
  – Streams:
    • Higher level interface to files and devices
      – Provides uniform interface; easy to deal with, but less powerful
    • Type: FILE *

Streams are more portable, and more accessible to beginning programmers. (I teach streams here.)
File I/O

• Process for reading or writing
  – Open a file
    • Tells Unix you intend to do file I/O
    • Function returns a “FILE *
      – Used to identify the file from this point forward
    • Checks to see if permissions are valid
  – Read from the file / write to the file
  – Close the file
Opening a file

• FILE *handle = fopen(filename, mode);

The argument mode points to a string beginning with one of the following sequences (Additional characters may follow these sequences.):

```
`r'' Open text file for reading. The stream is positioned at the beginning of the file.
`r+'' Open for reading and writing. The stream is positioned at the beginning of the file.
```

Example: FILE *h = fopen("/tmp/330", "wb");

exist, otherwise it is truncated. The stream is positioned at the beginning of the file.

```
`a+'' Open for reading and writing. The file is created if it does not exist. The stream is positioned at the end of the file. Subsequent writes to the file will always end up at the then current end of file, irrespective of any intervening fseek(3) or similar.
```

Close when you are done with “fclose”

Note: #include <stdio.h>
Unix and Windows difference

• Unix:
  – “\n”: goes to next line, and sets cursor to far left

• Windows:
  – “\n”: goes to next line (cursor does not go to left)
  – “\m”: sets cursor to far left

• Text files written in Windows often don’t run well on Unix, and vice-versa
  – There are more differences than just newlines

vi: “set ff=unix” solves this
Example

C02LN00GFD58:330 hank$ cat rw.c
#include <stdio.h>
#include <string.h>

int main(int argc, char *argv[])
{
    char *hello = "hello world: file edition\n";
    FILE *f = fopen("330", "w");
    fwrite(hello, sizeof(char), strlen(hello), f);
    fclose(f);
}

C02LN00GFD58:330 hank$ gcc rw.c
C02LN00GFD58:330 hank$ ./a.out
C02LN00GFD58:330 hank$ cat 330
hello world: file edition
```c
#include <stdio.h>
#include <printf.h>
#include <stdlib.h>

int main(int argc, char *argv[]) {
    FILE *f_in, *f_out;
    int buff_size;
    char *buffer;

    if (argc != 3) {
        printf("Usage: %s <file1> <file2>\n", argv[0]);
        exit(EXIT_FAILURE);
    }

    f_in = fopen(argv[1], "r");
    fseek(f_in, 0, SEEK_END);
    buff_size = ftell(f_in);
    fseek(f_in, 0, SEEK_SET);

    buffer = malloc(buff_size);
    fread(buffer, sizeof(char), buff_size, f_in);

    printf("Copying %d bytes from %s to %s\n", buff_size, argv[1], argv[2]);

    f_out = fopen(argv[2], "w");
    fwrite(buffer, sizeof(char), buff_size, f_out);

    fclose(f_in);
    fclose(f_out);

    return 0;
}
```
Printing to terminal and reading from terminal

• In Unix, printing to terminal and reading from terminal is done with file I/O

• Keyboard and screen are files in the file system!
  – (at least they were ...)
Standard Streams

• Wikipedia: “preconnected input and output channels between a computer program and its environment (typically a text terminal) when it begins execution”

• Three standard streams:
  – stdin (standard input)
  – stdout (standard output)
  – stderr (standard error)

What mechanisms in C allow you to access standard streams?
printf

• Print to stdout
  – printf(“hello world\n”);
  – printf(“Integers are like this %d\n”, 6);
  – printf(“Two floats: %f, %f”, 3.5, 7.0);
fprintf

- Just like printf, but to streams
  - `fprintf(stdout, "helloworld\n");`
    - → same as printf
  - `fprintf(stderr, "helloworld\n");`
    - prints to "standard error"
  - `fprintf(f_out, "helloworld\n");`
    - prints to the file pointed to by FILE *f_out.
buffering and printf

• Important: printf is buffered
• So:
  – printf puts string in buffer
  – other things happen
  – buffer is eventually printed
• But what about a crash?
  – printf puts string in buffer
  – other things happen ... including a crash
  – buffer is never printed!

Solutions: (1) fflush, (2) fprintf(stderr) always flushed

Worth 4% of your grade

Assignment: Write a program that reads the file “2E_binary_file”. This file contains a two-dimensional array of integers, that is 10x10. You are to read in the 5x5 bottom left corner of the array. That is, the values 0-4, 10-14, 20-24, 30-34, and 40-44. You may only read 25 integers total. Do not read all 100 and throw some out. You will then write out the new 5x5 array. Please write this as strings, one integer per line (25 lines total). You should be able to “cat” the file afterwards and see the values.

Use Unix file streams for this project (i.e., fopen, fread, fseek, fprintf). Your program will be checked for good programming practices. (Close your file streams, use memory correctly, etc. I am not referring to style, variable initialization, etc.)

Also, add support for command line arguments (argc and argv).

Your program should run as:

./<prog_name> <input_name> <output_name>

(The input_name will be 2E_binary_file, unless you change it.)

Finally, note that I am handing you a binary file. I think we are all little endian, and so it will be fine. But, if it is big endian, then we will have a problem. You can check if it is little endian by printing the first two values of the file. They should be “0” and “1”.

Please submit a tarball with (1) a Makefile (should be simple), (2) your source code, and (3) the output ASCII file from running your program, with the name “ASCII_output”.

Enums

- Enums make your own type
  - Type is “list of key words”
- Enums are useful for code clarity
  - Always possible to do the same thing with integers
- Be careful with enums
  - ... you can “contaminate” a bunch of useful words
enum example

C keyword “enum” – means enum definition is coming

```c
enum StudentType {
    HighSchool,
    Freshman,
    Sophomore,
    Junior,
    Senior,
    GradStudent
};
```

This enum contains 6 different student types

semi-colon!!!
enum example

```c
int AverageAge(enum StudentType st)
{
    if (st == HighSchool)
        return 16;
    if (st == Freshman)
        return 18;
    if (st == Sophomore)
        return 19;
    if (st == Junior)
        return 21;
    if (st == Senior)
        return 23;
    if (st == GradStudent)
        return 26;

    return -1;
}
```
enums translate to integers ... and you can set their range

```c
#include <stdio.h>

define StudentType
{
    HighSchool = 105,
    Freshman,
    Sophomore,
    Junior,
    Senior,
    GradStudent
};

int main()
{
    printf("HighSchool = %d, GradStudent = %d\n", HighSchool, GradStudent);
}
```

```
128-223-223-72-wireless:330 hank$ cat enum2.c
128-223-223-72-wireless:330 hank$ gcc enum2.c
128-223-223-72-wireless:330 hank$ ./a.out
HighSchool = 105, GradStudent = 110
```
But enums can be easier to maintain than integers

```c
enum StudentType
{
    HighSchool,
    Freshman,
    Sophomore,
    Junior,
    Senior,
    PostBacc,
    GradStudent
};

int AverageAge(enum StudentType st)
{
    if (st == HighSchool)
        return 16;
    if (st == Freshman)
        return 18;
    if (st == Sophomore)
        return 19;
    if (st == Junior)
        return 21;
    if (st == Senior)
        return 23;
    if (st == PostBacc)
        return 24;
    if (st == GradStudent)
        return 26;

    return -1;
}
```

If you had used integers, then this is a bigger change and likely to lead to bugs.

• Project 2C
Data types

- float
- double
- int
- char
- unsigned char

All of these are simple data types
Structs: a complex data type

• Construct that defines a group of variables
  – Variables must be grouped together in contiguous memory

• Also makes accessing variables easier ... they are all part of the same grouping (the struct)
struct syntax

C keyword “struct” – means struct definition is coming

```c
struct Ray
{
    double origin[3];
    double direction[3];
};
```

This struct contains 6 doubles, meaning it is 48 bytes

```
int main()
{
    struct Ray r;
    r.origin[0] = 0;
    r.origin[1] = 0;
    r.origin[2] = 0;
    r.direction[0] = 1;
    r.direction[1] = 0;
    r.direction[2] = 0;
}
```

Declaring an instance

“.” accesses data members for a struct
Nested structs

```c
struct Origin
{
    double originX;
    double originY;
    double originZ;
};

struct Direction
{
    double directionX;
    double directionY;
    double directionZ;
};

struct Ray
{
    struct Origin ori;
    struct Direction dir;
};

int main()
{
    struct Ray r;
    r.ori.originX = 0;
    r.ori.originY = 0;
    r.ori.originZ = 0;
    r.dir.directionX = 0;
    r.dir.directionY = 0;
    r.dir.directionZ = 0;
}
```

accesses dir part of Ray

accesses directionZ part of Direction (part of Ray)
typedef

- typedef: tell compiler you want to define a new type

```c
typedef struct Ray
{
    double origin[3];
    double direction[3];
} Ray;
```

```c
int main()
{
    struct Ray r;
    r.origin[0] = 0;
    r.origin[1] = 0;
    r.origin[2] = 0;
    r.direction[0] = 1;
    r.direction[1] = 0;
    r.direction[2] = 0;
}
```
Other uses for typedef

- Declare a new type for code clarity
  - typedef int MilesPerHour;
    - Makes a new type called MilesPerHour.
    - MilesPerHour works exactly like an int.

- Also used for enums & unions
  - same trick as for structs ... typedef saves you a word

• Project 2B
• Enum
• Struct
• Union
• Project 2C
Unions

• Union: special data type
  – store many different memory types in one memory location

```c
typedef union
{
    float x;
    int    y;
    char   z[4];
} cis330_union;
```

When dealing with this union, you can treat it as a float, as an int, or as 4 characters.

This data structure has 4 bytes
Unions

Why are unions useful?

typedef union
{
    float x;
    int y;
    char z[4];
} cis330_union;

int main()
{
    cis330_union u;
    u.x = 3.5; /* u.x is 3.5, u.y and u.z are not meaningful */
    u.y = 3;  /* u.y is 3, now u.x and u.z are not meaningful */
    printf("As u.x = %f, as u.y = %d\n", u.x, u.y);
}

128-223-223-72-wireless:330 hank$ gcc union.c
128-223-223-72-wireless:330 hank$ ./a.out
As u.x = 0.000000, as u.y = 3
typedef struct {
    int firstNum;
    char letters[3];
    int endNums[3];
} CA_LICENSE_PLATE;

typedef struct {
    char letters[3];
    int nums[3];
} OR_LICENSE_PLATE;

typedef struct {
    int nums[6];
} WY_LICENSE_PLATE;

typedef union {
    CA_LICENSE_PLATE ca;
    OR_LICENSE_PLATE or;
    WY_LICENSE_PLATE wy;
} LicensePlate;
Unions Example

typedef struct
{
    int firstNum;
    char letters[3];
    int endNums[3];
} CA_LICENSE_PLATE;

typedef struct
{
    char letters[3];
    int nums[3];
} OR_LICENSE_PLATE;

typedef struct
{
    int nums[6];
} WY_LICENSE_PLATE;

typedef union
{
    CA_LICENSE_PLATE ca;
    OR_LICENSE_PLATE or;
    WY_LICENSE_PLATE wy;
} LicensePlate;

typedef enum
{
    CA,
    OR,
    WY
} US_State;

typedef struct
{
    char *carMake;
    char *carModel;
    US_State state;
    LicensePlate lp;
} CarInfo;

int main()
{
    CarInfo c;
    c.carMake = "Chevrolet";
    c.carModel = "Camaro";
    c.state = OR;
    c.lp.or.letters[0] = 'X';
    c.lp.or.letters[1] = 'S';
    c.lp.or.letters[2] = 'Z';
    c.lp.or.nums[0] = 0;
    c.lp.or.nums[1] = 7;
    c.lp.or.nums[2] = 5;
}
Why are Unions useful?

• Allows you to represent multiple data types simultaneously
  – But only if you know you want exactly one of them
• Benefit is space efficiency, which leads to performance efficiency

Unions are also useful for abstracting type. We will re-visit this when we talk about C++’s templates.

• Unions
• Project 2C
Project 2C

Worth 4% of your grade

Assignment: You will implement 3 structs and 9 functions. The prototypes for the functions are located in the file prototypes.h (available on the website).

The three structs are Rectangle, Circle, and Triangle, and are described below.

The 3 structs refer to 3 different shapes: Triangle, Circle, and Rectangle. For each shape, there are 3 functions: Initialize, GetArea, and GetBoundingBox. You must implement 9 functions total (3*3).

The prototypes for these 9 functions are available in the file prototypes.h.

There is also a driver program, and correct output for the driver program.
Bonus Material

Mangling

- Mangling refers to combing information about the return type and arguments and “mangling” it with function name.
  - Way of ensuring that you don’t mix up functions.

- Causes problems with compiler mismatches
  - C++ compilers haven’t standardized.
  - Can’t take library from icpc and combine it with g++.
C++ will let you overload functions with different types

```c
float doubler(float f) { return 2*f; }
int doubler(int f) { return 2*f; }
```

```
C02LN00GFD58:330 hank$ cat t.c
float doubler(float f) { return 2*f; }
int doubler(int f) { return 2*f; }
C02LN00GFD58:330 hank$ gcc -c t.c
```
```
t.c:2:5: error: conflicting types for 'doubler'
int doubler(int f) { return 2*f; }
^
```
```
t.c:1:7: note: previous definition is here
float doubler(float f) { return 2*f; }
^
```
1 error generated.
```
C02LN00GFD58:330 hank$ g++ -c t.C
C02LN00GFD58:330 hank$
```
C++ also gives you access to mangling via “namespaces”

```c
#include <stdio.h>

namespace CIS330
{
    int GetNumberOfStudents(void) { return 56; };
}

namespace CIS610
{
    int GetNumberOfStudents(void) { return 9; };
}

int main()
{
    printf("Number of students in 330 is %d, but in 610 was %d\n",
           CIS330::GetNumberOfStudents(),
           CIS610::GetNumberOfStudents());
}
```

Functions or variables within a namespace are accessed with “::”
C++ also gives you access to mangling via “namespaces”

The “using” keyword makes all functions and variables from a namespace available without needing “::”. And you can still access other namespaces.

```cpp
namespace CIS610
{
    int GetNumberOfStudents(void) { return 9; };
}

using namespace CIS330;

int main()
{
    printf("Number of students in 330 is %d, but in 610 was %d\n", 
           CIS610::GetNumberOfStudents(),
           CIS610::GetNumberOfStudents());
}
```
Backgrounding

• “&”: tell shell to run a job in the background
  – Background means that the shell acts as normal, but the command you invoke is running at the same time.

• “sleep 60” vs “sleep 60 &”

When would backgrounding be useful?
Suspending Jobs

• You can suspend a job that is running
  Press “Ctrl-Z”
• The OS will then stop job from running and not schedule it to run.
• You can then:
  – make the job run in the background.
    • Type “bg”
  – make the job run in the foreground.
    • Type “fg”
      – like you never suspended it at all!!
Web pages

- ssh –l <user name> ix.cs.uoregon.edu
- cd public_html
- put something in index.html
- → it will show up as

http://ix.cs.uoregon.edu/~<username>
• You can also exchange files this way
  – scp file.pdf <username>@ix.cs.uoregon.edu:~/public_html
  – point people to http://ix.cs.uoregon.edu/~<username>/file.pdf

Note that ~/public_html/dir1 shows up as
http://ix.cs.uoregon.edu/~<username>/dir1

("~/dir1" is not accessible via web)
